ABSTRACT

A method for running a software application on a
computer having an operating system that provides a local
database containing consistent configuration data to be
accessed by programs running on the computer. The method
includes   providing   a   file   containing   further
configuration data required by the application, which
further data are not stored in the local database. A
request by the application to access the local database
is intercepted, and an item of the further configuration
data is returned from the file to the application,
responsive to the request.
